

JP2000-270069A

[0025] A camera mode is a mode for converting an image formed via a lens 108 disposed at the photographing part 1 to an electronic signal by a photoelectric conversion device, and for storing it to a storing unit such as a flash memory with processing by the system unit. A strobe 109 is disposed underneath the lens 108 of the system unit, and flashlights an object with selecting flashing conditions from the menu displayed on the crystal display 104 by using a pointing device 110. Functions such as deleting unnecessary imaged images with confirmation, or storing sound as annotation (see the notes), sending them to a desired location as an mail, are equipped in the camera mode.
